# OCCAM's RAZOR

14th Century logician and Franciscan priest William of Ockham

**"Entities should not be multiplied unnecessarily."**

*"Entia non sunt multiplicanda praeter necessitatem"*

In an extended version:

**"If you have two equally likely solutions to a problem, choose the simplest."**

**OCCAM's RAZOR is an important guiding principle of OPM**

Occam's  
Razor

William of Ockham  
1288 - 1348

# Theoretical Foundation 1: Three Cognitive Assumptions

- (1) ***Dual-channel processing*** – humans possess **separate** systems for processing **visual** and **verbal** representations (Clark & Paivio, 1991; Baddeley, 1992).
- (2) ***Limited capacity*** – the amount of processing that can take place within each information processing channel is **extremely limited** (Miller, 1956; Chandler & Sweller, 1991; Baddeley, 1992).
- (3) ***Active processing*** – meaningful **learning** occurs during **active** cognitive **processing**, paying attention to words and pictures.

Mayer, R.E. (2003). The promise of multimedia learning: using the same instructional design methods across different media.

Learning and Instruction, 13, pp. 125-139.

# OPM Design Principle 1: Simplicity

- Simplicity is a must for modeling systems
- We cannot ignore the **inherent complexity** of systems.

However,

- We can simplify the way systems are modeled
  - without sacrificing accuracy, and
  - without sparing details.

## OPM Design Principle 2: Minimum Description Length

- If the same system can be expressed by two languages with the same level of fidelity, the one with the shortest description is preferred.
  - Inspired by The Minimum Description Length (MDL) Principle (Rissanen 1978)

Rissanen, J. (1978). Modeling by shortest data description. *Automatica*, 14: 465-471.

# OPM Theoretical Foundation

## Universal Ontology

Let's get to it via  
asking Socratic Questions

# Theoretical Foundation 2: Ontology & Universal Ontology

## Ontology:

a set of **concepts** and **relations** for describing a **domain** and systems within it.

## Universal Ontology:

a **domain-independent** set of concepts and relations for describing systems in the universe, both natural and man-made.

**Fundamental question 1:**  
**What is needed to**  
**describe the universe and**  
**systems in it?**

**Answer:**

**Things and**  
**relations among them.**

## Question 2: What **is** a thing or what can it **do**?

### Answer:

A things can either  
**exist** at some point in **time**  
or  
**happen** over **time**

Any **thing** can either **exist** or **happen** – nothing else;  
Every **thing** can be classified into one of these two!

## Question 3:

What are the  
things that **exist** in  
the world?

Poem

I am like a fish  
in love with a bird  
wishing I could fly

Satellite

Tree

Number

House

Meteorite

**Answer:**

**Objects** *exist*.

*They are **static** –*

*time independent. (syntactically: **nouns**)*

## Question 4:

What are the things that  
*happen* in the world?

**Answer:**

**Processes** *happen*.

They are **dynamic** –  
*time dependent*.

(syntactically:

verbs in gerund form: “...ing”)

Crashing

Baking

Fighting

Launching

Processes do not happen in vacuum!

**Question 5:**  
**Whom do processes**  
**happen to?**

**Answer:**  
**Processes happen to objects.**

## Question 6:

What does a **process** do when it happens to an **object**?

## Answer:

The **process** *transforms* the **Object**.

# Only two OPM Things: Objects and Processes

Charging changes Battery  
from depleted to charged.

**Object:** A thing that exists or might exist physically or informatically.

**Process:** A thing that transforms or might transform one or more objects.

processes *transform* objects.

## Question 7:

In what three ways does a process *transform* an object?

## Answer:

1. *creating* an object
2. *destroying* an object
3. *affecting* an object.

Generation

Consumption

Effect

# The first kind of transforming: Generation

The process can *create* the object

Manufacturing yields Product.

# The second kind of transforming: Consumption

The **process** can *consume* the **object**

Manufacturing consumes Raw Material.

# The third kind of transforming: Effect

The **process** can *affect* the **object**

## Question 8:

How does a process *affect* an object?

## Answer:

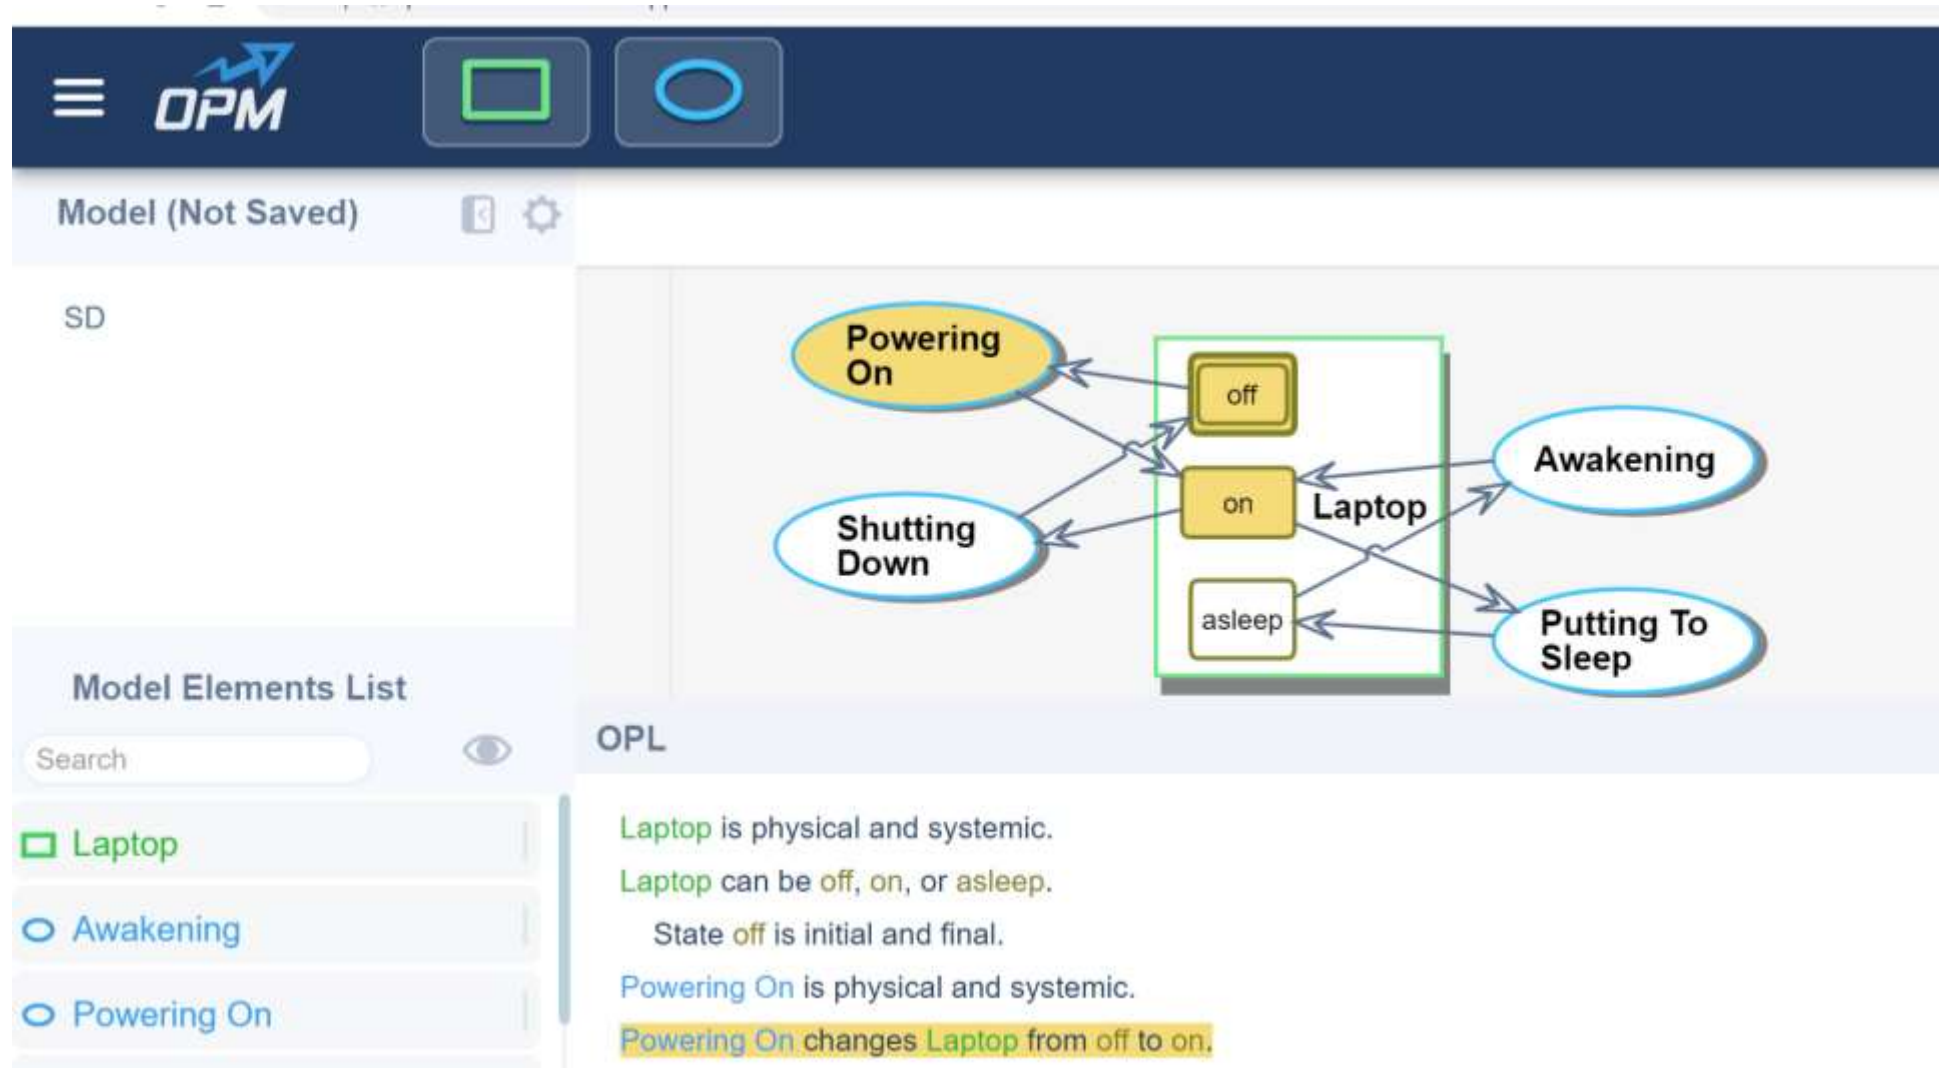

- A **process** *affects* an **object** *by changing its state.*
- Hence, **objects** *must be stateful – they must have states.*

# State: A situation an object can be at during its lifetime.

At each point in time, the object is

- at one of its states, or
- in transition from an *input state*
  - the input to the affecting process
- to its *output state*
  - the output of that process

# State transitions example

# The graphics-text equivalence OPM principle

Any model fact expressed **graphically** in an OPD is also expressed **textually** in the corresponding OPL paragraph.

Each modality is reconstructible from the other.

This bimodal representation caters to the dual channel cognitive assumption (Mayer, 2010)

Tree is physical and systemic.

Tree can be small or big.

State small is initial.

State big is final.

Growing is physical and systemic.

Growing changes Tree from small to big.

# Question 9: What are the two major aspects of any system?

- **Structure** – the static aspect:  
*What* the system is made of.
  - *Objects and relations among them*
  - *Time-independent*
- **Behavior** – the dynamic aspect:  
*How* the system changes over time.
  - *Processes and how they transform objects*
  - *Time-dependent*
- **Time** is the **discriminating** factor!

So far we discussed systems in general, without distinguishing natural systems from man-made ones

However, there is a fundamental difference between the two

# Question 10: What third aspect is specific to human-made systems?

- **Function** – the utilitarian, subjective, benefit-providing aspect:
  - **Why** is the system built?
  - **For whom** is the system built?
  - **Who** benefits from operating the system?
- Function can be defined as any pair of **process** and its **operand**
  - e.g., **Battery Charging**; **Blood Pumping**
  - Natural systems may be beneficial or detrimental.

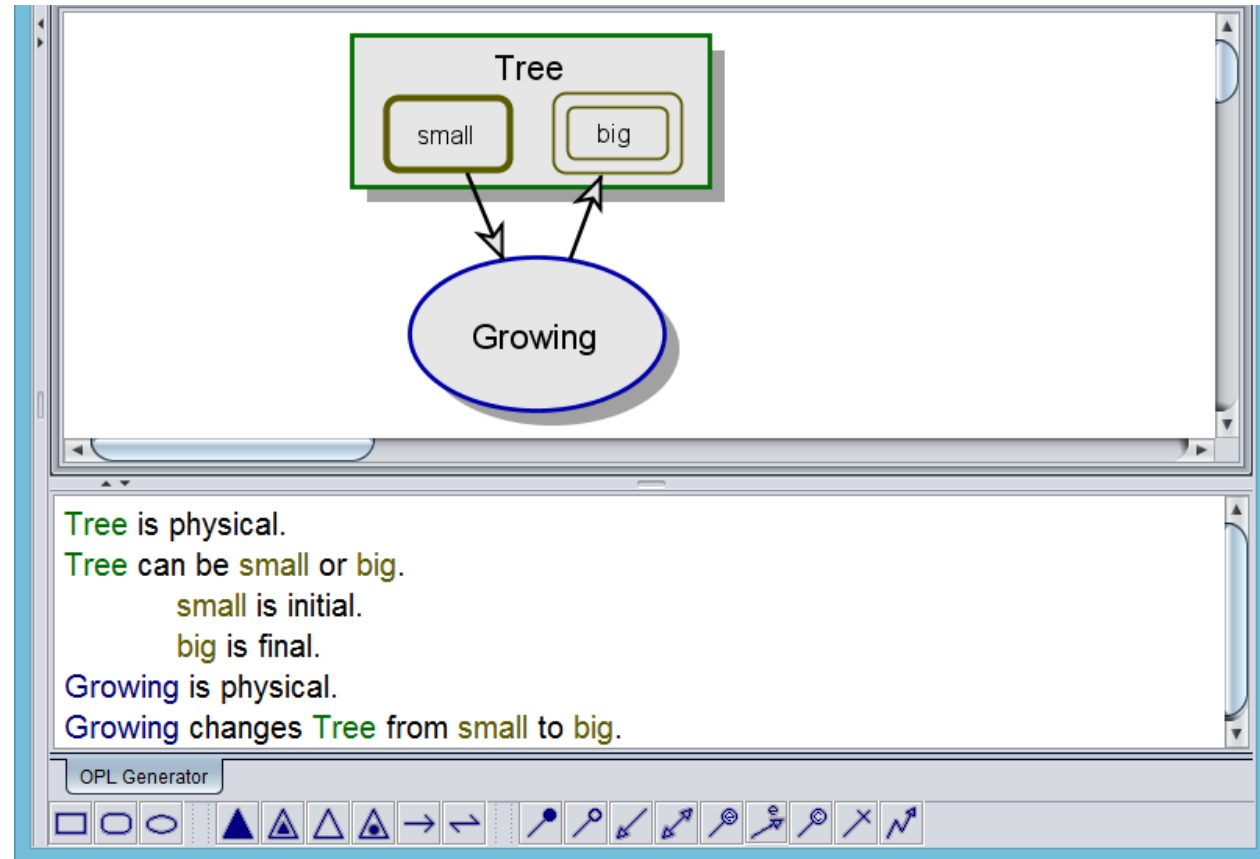

Charging changes Battery from depleted to charged.

# The graphics-text equivalence OPM principle

Any model fact  
expressed  
graphically in an  
OPD is also  
expressed textually  
in the  
corresponding OPL  
paragraph.

Caters to the  
dual channel  
cognitive  
assumption  
(Mayer, 2010)

- A process (even a physical one) is a cognitive pattern, in which we:
  - compare an object existence, or its state, in time points in the past vs. now, and
  - use this data to create a mental picture of the transformation the object undergoes.
- Only the objects involved in a physical process can be “touched”

# The Object-Process Theorem

Stateful **objects**, **processes**,  
and **relations** among them  
constitute a **universal ontology**.

Caveat: May not apply to quantum-scale systems  
(e.g., an electron may be both an object and a process)

## Two Complementary Proofs:

1. Theoretical, based on logic and set theory
2. Empirical, based on many examples from many domains; no counter example found

# The Things Axiom

The set  $T$  of all things (or entities, or concepts) in the universe is the union of two disjoint sets:

**stateful objects**  $\Omega$  and **processes**  $\Pi$ :

$$T = \Omega \cup \Pi; \Omega \cap \Pi = \phi$$

Every thing is either an object or a process

# The Things-Relations Axiom

Representing any system  $\Sigma$  requires  
a set of things **T** and relations  
among them, **R**:

$$\text{Rep } \Sigma \rightarrow \mathbf{T} \wedge \mathbf{R}$$

# The Relations Lemma

- Let  $\mathcal{R}_s$  be the set of all the structural relations:

relations between two objects,  $\mathcal{R}_{s(\Omega)}$ , or between two processes  $\mathcal{R}_{s(\Pi)}$ :

$$\mathcal{R}_s = \mathcal{R}_{s(\Omega)} \cup \mathcal{R}_{s(\Pi)}$$

Where

$$\mathcal{R}_{s(\Omega)} = \{\rho \mid \omega_i \rho \omega_j; \omega_i, \omega_j \in \Omega\}$$

$$\mathcal{R}_{s(\Pi)} = \{\rho \mid \pi_i \rho \pi_j; \pi_i, \pi_j \in \Pi\}$$

# The Relations Lemma (cont.)

- Let  $\mathcal{R}_P$  be the set of all the procedural relations: relations between an object and a process:

$$\mathcal{R}_P = \{\rho \mid \omega_i \rho \pi_j; \omega_i \in \Omega, \pi_j \in \Pi\}$$

Then the set of all possible relations  $\mathcal{R}$  between things in the universe is  $\mathcal{R} = \mathcal{R}_S \cup \mathcal{R}_P$

**Or: Any relation is either structural or procedural.**

# Relations Lemma Proof

According to the Things Axiom, every thing is either an object or a process:  $T = \Omega \cup \Pi$

Therefore, relations can only exist between

- (1) Two objects: These are in  $\mathcal{R}_{S(\Omega)}$ ,
- (2) Two processes: These are in  $\mathcal{R}_{S(\Pi)}$ ,
- (3) An object and a process: These are in  $\mathcal{R}_P$

Therefore,  $\mathcal{R} = \mathcal{R}_{S(\Omega)} \cup \mathcal{R}_{S(\Pi)} \cup \mathcal{R}_P$

Substituting  $\mathcal{R}_S = \mathcal{R}_{S(\Omega)} \cup \mathcal{R}_{S(\Pi)}$

we get:  $\mathcal{R} = \mathcal{R}_S \cup \mathcal{R}_P$  QED

# The Object-Process Theorem

**Stateful objects, processes, and relations among them constitute a necessary and sufficient universal ontology.**

**Or:** It is possible to **specify** any **system** in the universe using **stateful objects, processes, and relations** among them.

**Caveat:** May not apply to quantum-scale systems

# Theoretical Proof Part 1 – Necessity

We need to show:

**Stateful objects**, **processes**, and **relations** among them are a necessary universal ontology.

*In other words:*

A set of **stateful objects**  $\Omega$ ,  
a set of **processes**  $\Pi$ , and  
a set of **relations**  $\mathfrak{R}$  among them  
are required to specify any system  $\Sigma$  in any  
domain in the universe.

*Symbolically:*  $\text{Rep } \Sigma \rightarrow \Omega \wedge \Pi \wedge \mathfrak{R}$   
 $\text{Rep } (\Sigma) \rightarrow T \wedge \mathfrak{R}$

# Theoretical Proof Part 1 – Necessity

System aspect representation

Representing any system  $\Sigma$  requires  
representing its two aspects:

Structure,  $S(\Sigma)$  and

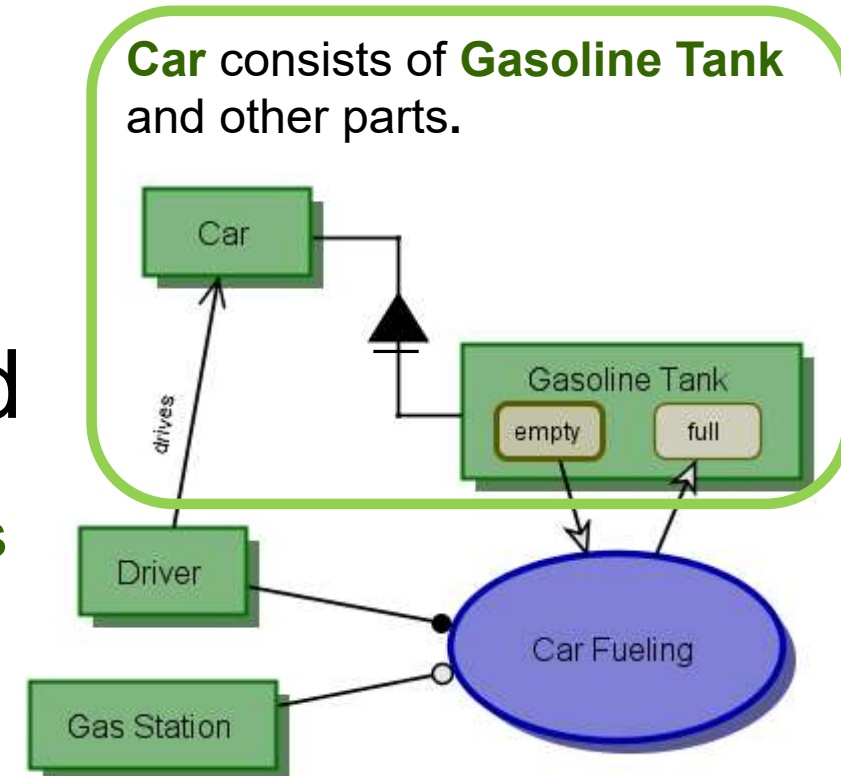

Behavior,  $B(\Sigma)$

**Rep**  $\Sigma \rightarrow S(\Sigma) \wedge B(\Sigma)$

# System structure representation

Representing  $S(\Sigma)$   
(the system's  
structure) requires  
stateful objects  $\Omega$  and  
structural relations  $R_s$   
to link them:

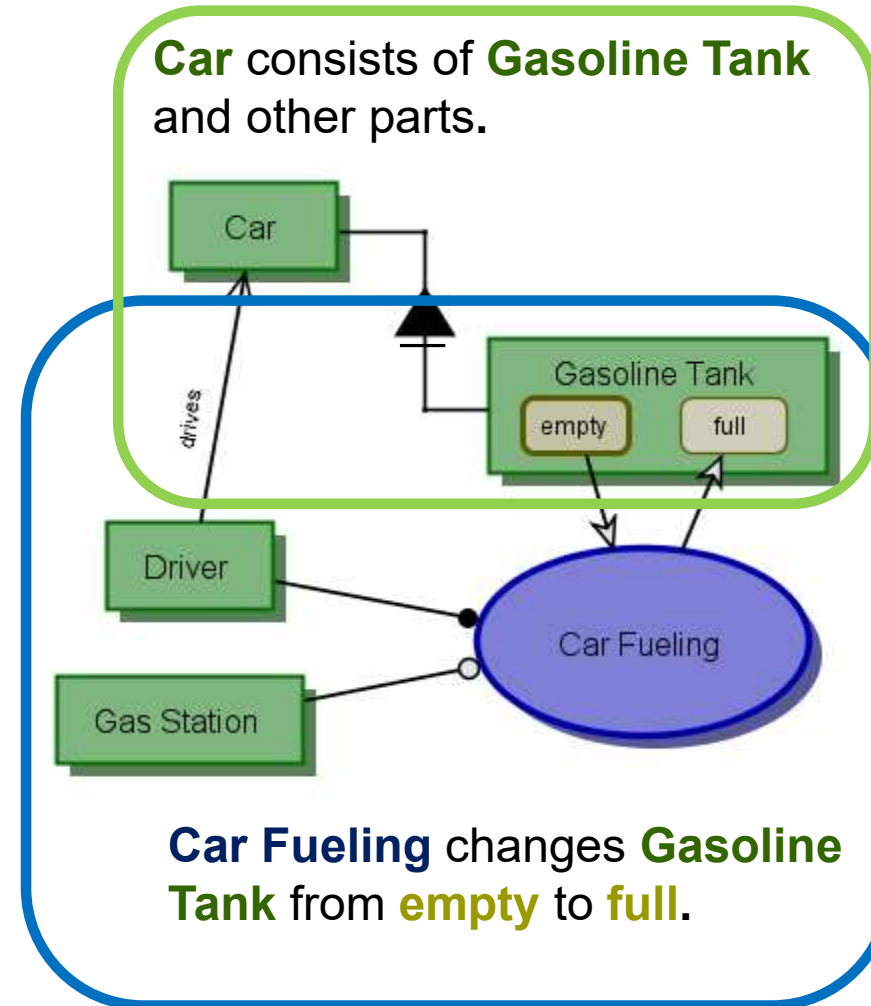

$$S(\Sigma) = \Omega \cup \mathcal{R}_s$$

# System behavior representation

Representing  $B(\Sigma)$  (the system's behavior) requires processes  $\Pi$  and procedural relations  $\mathcal{R}_P$  to link them to the objects they transform:

$$B(\Sigma) = \Pi \cup \mathcal{R}_P$$

# Substitution

We had:

$$\text{Rep } \Sigma \rightarrow S(\Sigma) \wedge B(\Sigma)$$

Substituting

$$S(\Sigma) = \Omega \cup \mathcal{R}_S$$

$$B(\Sigma) = \Pi \cup \mathcal{R}_P$$

We get:

$$\text{Rep } \Sigma \rightarrow (\Omega \cup \mathcal{R}_S) \wedge (\Pi \cup \mathcal{R}_P)$$

Rearranging terms (thanks to commutativity of union and conjunction) we get:

$$\text{Rep } \Sigma \rightarrow (\Omega \cup \Pi) \wedge (\mathcal{R}_S \cup \mathcal{R}_P)$$

The Things Axiom states that:

$$T = \Omega \cup \Pi$$

So the first term is the set of Things  $T$  and the second – the Relations  $\mathcal{R}$ :

$$\text{Rep } \Sigma \rightarrow T \wedge \mathcal{R}$$

## Theoretical Proof Part 2 - Sufficiency

**Stateful objects** and **processes** are sufficient to specify any thing in any system, because:

- Anything that *exists* or *might exist* can be specified in terms of **stateful objects** and **relations** among them.
- Anything that *happens* or *might happen* to any stateful object can be specified in terms of **processes** and **relations** between the processes and the **stateful objects** they transform.

Q.E.D.

## Why does this make sense?

### The universe is four-dimensional:

- Three spatial dimensions:  $x$ ,  $y$ ,  $z$ , for the static aspect
- One temporal dimension:  $t$  for the dynamic aspect
- Objects are **static** only in a snapshot (slice) of time  $t$ .
- To describe the **dynamic** aspect we must use  $t$  and show how objects change over time – these are the processes.

# Empirical Proof of the Object-Process Theorem

Stateful objects, processes, and relations among them constitute a necessary and sufficient universal ontology.

If the ontology is universal, it must be able to model systems in any domain.

The empirical proof: Providing evidence of successful models from various, unrelated domains.

# Complexity Management with OPM

- Systems are inherently complex.
- To alleviate this complexity, in OPM, it is managed by detail decomposition through three refinement-abstraction:
  - In-zooming – Out-zooming
  - Unfolding – Folding
  - State expression – suppression.

# In-zooming – Out-zooming Example

## Process Performance Controlling - a metamodel from ISO 19450

# OPM Complexity Management Benefits

- There is no limit on the level of complexity of the system being modeled:
  - One can specify system structure and behavior at any level of detail by recursively in-zooming.
- Catering to the cognitive limited capacity:
  - Each diagram is not overly complicated.
- All the diagrams are “aware” of each other:
  - All OPDs are partial views of the same system.
  - Any change in one diagram is propagated to all the other relevant ones.
  - All OPDs, regardless of the level of detail, are self-similar: They all use the same compact universal ontology

# OPM – Object-Process Methodology

- A language and methodology for modeling complex systems of any kind
- Recognized as ISO 19450
- Based on the minimal universal ontology of
  - stateful objects
  - processes that transform objects by:
    - Creating new objects
    - Consuming existing ones, or
    - Changing their states

# OPM – Highlights

- Bi-modal visual-textual presentation:
  - OPD – Object-Process Diagram
  - OPL – Object-Process Language
- Complexity management:
  - Things – objects and processes – can be refined to any desired level of detail
  - Via refinement-abstraction mechanisms:
    - In-zooming – Out-zooming (primarily for processes)
    - Unfolding – Folding (primarily for objects)
    - Expressing – Suppressing (for states)

# OPM – More Highlights

- Executable:
  - Objects can be computational (numbers, parameters)
  - Processes can perform math and embed code
  - The model can be seamlessly and concurrently executed both
    - conceptually-qualitatively and
    - concretely-qualitatively
  - In two modes:
    - Online live graphic mode: animation for visualization & debugging
    - Offline batch mode: numeric simulation for big data, statistical analysis

# 2015: OPM becomes ISO 19450

The screenshot shows the ISO Online Browsing Platform (OBP) interface. The top navigation bar includes the ISO logo, a search bar, and links for 'Buy', 'Follow', and 'i'. The main heading is 'ISO/PAS 19450:2015(en) Automation systems and integration — Object-Process Methodology'. Below this, there is a 'Table of contents' section with a list of items: Foreword, Introduction, 1 Scope, 2 Normative references, 3 Terms and definitions (highlighted), 4 Symbols, 5 Conformance, 6 OPM principles and concepts (expanded), 7 OPM thing syntax and semantics (expanded), and 8 OPM modelling principles (expanded). The '3 Terms and definitions' section is expanded, showing sub-sections 3.42, 3.43, and 3.44. Sub-section 3.42 is 'Object-Process Language OPL', described as a subset of English natural language that represents textually the Object-Process Methodology (3.43) model that the Object-Process Diagram (3.42) represents graphically. Sub-section 3.43 is 'Object-Process Methodology OPM', described as a formal language and method for specifying complex, multidisciplinary systems in a single function-structure-behaviour unifying model that uses a bimodal graphic-text representation of objects (3.39) in the system and their transformation (3.77) or use by processes (3.58). Sub-section 3.44 is partially visible.

Active Learning Highlight  
& Technological achievement:

- OPCloud embedded in edX
- Using LTI standard and a dedicated server for
- Immediate response and
- Constructive feedback

The screenshot displays the OPM interface within a web browser. The top navigation bar includes the OPM logo and icons for window management. The main workspace shows a diagram with two entities: 'Car Chassis' and 'Charging Module Pile'. A blue arrow points from 'Charging Module Pile' to 'Car Chassis', indicating a whole-part relationship. On the left, a 'Draggable OPM Things' panel lists 'Car Chassis' and 'Charging Module Pile'. Below the diagram, an 'OPL' (Ontology Programming Language) section contains the following sentences:

- Car Chassis is physical and systemic.
- Charging Module Pile is informational and systemic.
- Car Chassis consists of Charging Module Pile.

A feedback modal is open in the bottom right corner, displaying the following information:

- Your score is 50%. You have submitted 4 times out of 5.
- Your solution is missing the following OPL sentence(s):
  - Charging module pile is physical and systemic.
- The following OPL sentences are redundant:
  - Charging module pile is informational and systemic.

A 'Close' button is located at the bottom of the modal.

# SysML and OPM – a brief comparison

Feature	SysML	OPM
Theoretical foundation	UML; Object-Oriented paradigm	Minimal universal ontology; Object-Process Theorem
Standard documentation number of pages	~1670=700 (UML Infrastructure) + 700 (UML Superstructure) + 270 (OMG SysML)	~180=100 (ISO 19450 main standard) + 80 (appendices)
Standardization body	OMG	ISO
Number of diagram kinds	9	1
Top-level concept	Block (UML object class)	Thing (object or process)
Complexity management guiding principle	Aspect-based decomposition	Detail-level-based decomposition
Hierarchical decomposition	In some diagram kinds	Yes
Number of symbols	~120	~20
Graphic modality	Yes	Yes
Textual modality	No	Yes
Built-in physical-informatical distinction	No	Yes
Systemic-environmental distinction	Partial (using boundaries)	Yes
Logical relations (OR, XOR, AND)	No	Yes
Probability modeling	No	Yes
Execution, animated simulation, validation and verification capability	Partial (in some tools for some diagram kinds)	Yes
Tool availability	Many, some free	Currently one free (OPCAT) from <a href="http://esml.iem.technion.ac.il/">http://esml.iem.technion.ac.il/</a> Cloud-based tool under development
